Please find below and/or attached an Office communication concerning this application or proceeding.

## Office Action Summary

Application No.

09/671,981

Applicant(s)

CLARK ET AL.

Examiner

Li B. Zhen

Art Unit

2126

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 15 April 2004.
- 2a) ☒ This action is **FINAL**.                      2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1-19 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-19 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \*    c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.

### DETAILED ACTION

1. Claims 1 – 19 are currently pending in the application.

#### ***Claim Rejections - 35 USC § 103***

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. **Claims 1, 2, 10 and 16 – 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent NO. 6,621,505 to Beauchamp in view of U.S. Patent NO. 5,535,389 to Elder.**

4. As to claim 1, Beauchamp teaches the invention substantially as claimed including managing communication flow [control the flow of the predefined process; col. 7, lines 40 – 62] between a user interface [client computer; col. 4, lines 63 – 67] and a computer application performing a task [applications 32-44, Fig. 2; col. 8, lines 55 – 67] comprising a plurality of steps [process steps 12-24, Fig. 2; col. 8, lines 55 – 67] the sequence of the steps controlled by the application [universal client 50 will guide the user through a series of steps to accomplish the desired process; col. 8, line 65 – col. 9, line 8] and the progression through the steps controlled by a user operating the user interface [one or more graphical controls for a user to control the flow of the predefined process; col. 7, lines 40 – 61], comprising:

(a) mapping each step [process step] to an output file [associate a screen with each process step; col. 23, lines 25 – 35] containing information to be sent to the user interface in support of the step [server may package together presentation metadata for the first screen in the process...based on the presentation metadata, the presentation manager of the universal client may renders on a display the standard screen type identified in the presentation metadata and formats the screen for the particular process step based on the presentation metadata; col. 25, lines 15 - 40];

(b) mapping each task to a output generator [XML generator] that generates an output [prepares the XML to be passed back] sent via an output medium [hypertext transport protocol; col. 6, lines 43 – 49] to the user interface [client computer; col. 4, lines 63 – 67] based upon the content of the output file [collects up all of the pertinent information necessary to render the next step on the universal client and sends that information to XML generator 236 which prepares the XML to be passed back to the universal client; col. 20, lines 47 – 67]; and

(c) a task object [process server] receiving a progressional input [navigational request] from the user interface [process server also controls the flow of the process when navigation requests are received from the universal client; col. 24, lines 36 – 57] and receiving a step sequence input [process metadata; col. 24, lines 36 – 57] from the application [retrieve data from an external application; col. 21, lines 40 – 55], the task object further performing the steps of:

(i) comparing the progressional input to the step sequence input to identify a subsequent step [rules engine of the process server evaluates the process

metadata against the step data returned from the universal client to determine the next step of the process; col. 24, lines 37 – 56],

(ii) identifying the output file mapped to the subsequent step [rules engine 234 collects up all of the pertinent information necessary to render the next step; col. 20, lines 47 – 67], and

(iii) calling the output generator mapped to the task to generate an output to the user interface based upon the content of the output file mapped to the subsequent step [rules engine 234 collects up all of the pertinent information necessary to render the next step on the universal client and sends that information to XML generator 236 which prepares the XML to be passed back to the universal client; col. 20, lines 47 – 67].

5. Although Beauchamp substantially teaches the invention as claimed, Beauchamp does not teach instantiating a task object modeling the task.

However, Elder teaches providing a repeatable business process capability in an object oriented computing environment [col. 2, lines 23 – 52], a sequence of steps [object-action message definitions and logical navigation statements; col. 10, lines 50 – 67] and instantiating a task object modeling a task [business process object is instantiated; col. 10, lines 50 – 67].

6. It would have been obvious to a person of ordinarily skilled in the art at the time of the invention to apply the teaching of instantiating a task object modeling a task as taught by Elder to the invention of Beauchamp because this provides a repeatable business process capability in the object oriented computing environment such that a

specific sequence of object-action messages can be repeated frequently and without introducing any user entry error into the sequence of messages [col. 2, lines 33 - 39 of Elder].

7. As to claim 19, Beauchamp as modified teaches a framework [navigational framework; col. 7, lines 40 – 62 of Beauchamp] for managing communication flow [control the flow of the predefined process; col. 7, lines 40 – 62 of Beauchamp] between a user interface [client computer; col. 4, lines 63 – 67 of Beauchamp] and a computer application performing a task [applications 32-44, Fig. 2; col. 8, lines 55 – 67 of Beauchamp] comprising a plurality of steps [process steps 12-24, Fig. 2; col. 8, lines 55 – 67 of Beauchamp], the sequence of the steps controlled by the application [universal client 50 will guide the user through a series of steps to accomplish the desired process; col. 8, line 65 – col. 9, line 8 of Beauchamp] and the progression through the steps controlled by a user operating the user interface [one or more graphical controls for a user to control the flow of the predefined process; col. 7, lines 40 – 61 of Beauchamp], comprising:

(a) an initialization file mapping each step [process step] to an output file [associate a screen with each process step; col. 23, lines 25 – 35 of Beauchamp] containing information to be sent to the user interface in support of the step [server may package together presentation metadata for the first screen in the process...based on the presentation metadata, the presentation manager of the universal client may renders on a display the standard screen type identified in the presentation metadata

Art Unit: 2126

and formats the screen for the particular process step based on the presentation metadata; col. 25, lines 15 – 40 of Beauchamp] and mapping each task to a output generator [XML generator] that generates an output [prepares the XML to be passed back] sent via an output medium [hypertext transport protocol; col. 6, lines 43 – 49 of Beauchamp] to the user interface [client computer; col. 4, lines 63 – 67 of Beauchamp] based upon the content of the output file [collects up all of the pertinent information necessary to render the next step on the universal client and sends that information to XML generator 236 which prepares the XML to be passed back to the universal client; col. 20, lines 47 – 67 of Beauchamp]; and

(b) a task object modeling the task [business process object is instantiated; col. 10, lines 50 – 67 of Elder], the task object receiving a progressional input [navigational request] from the user interface [process server also controls the flow of the process when navigation requests are received from the universal client; col. 24, lines 36 – 57] and receiving a step sequence input [process metadata; col. 24, lines 36 – 57] from the application [retrieve data from an external application; col. 21, lines 40 – 55], the task object further performing the steps of:

(i) comparing the progressional input to the step sequence input to identify a subsequent step [rules engine of the process server evaluates the process metadata against the step data returned from the universal client to determine the next step of the process; col. 24, lines 37 – 56],

(ii) identifying the output file mapped to the subsequent step [rules engine 234 collects up all of the pertinent information necessary to render the next step; col. 20, lines 47 – 67], and

(iii) calling the output generator mapped to the task to generate an output to the user interface based upon the content of the output file mapped to the subsequent step [rules engine 234 collects up all of the pertinent information necessary to render the next step on the universal client and sends that information to XML generator 236 which prepares the XML to be passed back to the universal client; col. 20, lines 47 – 67].

8. As to claim 2, Beauchamp as modified teaches each step [each process step] is mapped to an output file [a screen] on a one to one basis [associate a screen with each process step; col. 23, lines 25 – 35 of Beauchamp].

9. As to claim 10, Beauchamp as modified teaches step objects [business object] representing steps within the task and having a method to perform the steps [business object is simply an object that has methods and attributes and is used specifically as the "go between" to external systems... a screen may be the basic unit of getting work done in a process and may only require 1) specification of screen type, 2) definition of its purpose and 3) assignment of a business object; col. 13, lines 8 – 23 of Beauchamp]

Art Unit: 2126

10. As to claim 16, Beauchamp as modified teaches the sequence of the steps controlled by the application is obtained by the application from an external source [business objects may be named Java classes that provide access to any external data required during...execution of business processes. Each step within a process will often only deal with a subset of data from back-end systems; col. 21, lines 57 – 67 of Beauchamp].

11. As to claim 17, Beauchamp as modified teaches the external source is an initialization file [BOs 216 provide an abstraction layer that enables a process developer to consider external application data within the context of a process, Fig. 11; col. 22, lines 32 – 47 of Beauchamp].

12. As to claim 18, Beauchamp as modified teaches the external source is a database [process server 202 may connect to an enterprise's back-end applications and databases 204, Fig. 11; col. 22, lines 32 – 47 of Beauchamp].

13. **Claims 3 – 7, 9, 11, 12, 14 and 15 rejected under 35 U.S.C. 103(a) as being unpatentable over Beauchamp and Elder as applied to claim 2 above, and further in view of U.S. Patent NO. 6,012,098 to Bayeh.**

Art Unit: 2126

14. As to claim 3, Beauchamp as modified by Elder teaches the invention substantially as claimed. Beauchamp as modified does not teaches each task is mapped to an output generator on a one to one basis.

However, Bayeh teaches each task [Steps 280 through 320 are implemented by a rendering servlet...these steps represent the logic associated with data presentation formatting; col. 11, lines 25 – 30] is mapped to a output generator [rendering servlet] on a one to one basis [unique rendering servlets 85 might be created to format data according to different presentation requirements; col. 8, lines 36 – 65].

15. It would have been obvious to a person of ordinarily skilled in the art at the time of the invention to apply the teaching of mapping each task to a output generator on a one to one basis as taught by Bayeh to the invention of Beauchamp as modified by Elder because this optimizes system throughput by having multiple data servlets and multiple rendering servlets and prevents bottlenecks in the system, where one process is delayed by another process [col. 8, lines 44 – 50 of Bayeh].

16. As to claim 4, Beauchamp as modified teaches the output generator is a Java servlet [rendering servlet] generating a hypertext markup language output [second type of input to the rendering servlet 85 is an Extensible Style Language style sheet...XSL style sheet describes how XML information is to be presented as HTML. Using these two inputs, the rendering servlet 85 creates an HTML data stream; col. 9, lines 1 - 25 of Bayeh].

Art Unit: 2126

17. As to claim 5, Beauchamp as modified teaches the output generator is a Java applet [universal clients may run as Java applets under the Java virtual machine of an existing web browser; col. 19, lines 1 – 30 of Beauchamp] generating a hypertext markup language output [the client parses this response to produce the screen and its contents for the user; col. 24, lines 15 – 36 of Beauchamp].

18. As to claim 6, Beauchamp as modified teaches the HTML output [HTTP response] is generated from static HTML files having dynamic content [raw XML] inserted therein by an HTML template [XML gateway 250 parses the HTTP response from the process server and feeds the raw XML to an XML resolver 252...XML resolver 252 is responsible for parsing the XML tree to determine how the response should be presented; col. 21, lines 10 - 39 of Beauchamp].

19. As to claim 7, Beauchamp as modified teaches the output medium is hypertext transport protocol [client-computer may transmit requests...to the server computer using a protocol including hypertext transport protocol (HTTP); col. 6, lines 43 – 49 of Beauchamp].

20. As to claim 9, Beauchamp as modified teaches each step is mapped to an output file [process designer and the process server automatically perform all data and method mappings; col. 28, lines 18 – 33 of Beauchamp] using a screen map [data mapping is required for screen specialization; col. 28, lines 39 – 60 of Beauchamp].

21. As to claim 11, Beauchamp as modified teaches the progressional input comprises an instruction to proceed to the next step, go back to the previous step, or cancel the step [navigational control data may include requesting a next step of the predefined process from the server computer or requesting a previous step of the predefined process... Control data also may include data for pausing or canceling the current step of the predefined process; col. 6, lines 6 – 17 of Beauchamp].

22. As to claim 12, Beauchamp as modified teaches step sequence input from the application is received by implementing an abstract method [process designer may allow the developer to specify several types of step transitions which determine how the rules engine of the process server moves from step to step; col. 27, lines 10 – 26 of Beauchamp] that passes step sequence information from the application to the task object [rules engine of the process server evaluates the process metadata against the step data returned from the universal client to determine the next step of the process; col. 24, lines 37 – 56 of Beauchamp].

23. As to claim 14, Beauchamp as modified teaches a method to generate an error message as an output to the user interface [If the business process object 702 is not in a run state, then the routine is exited and an error is signalled to the user; col. 11, lines 47 – 67 of Elder].

24. As to claim 15, Beauchamp as modified teaches the method to generate an error message [If the business process object 702 is not in a run state, then the routine is exited and an error is signalled to the user; col. 11, lines 47 – 67 of Elder] further comprises extending an exception handling class [inherited attributes of a child process may be overridden, and may also be extended by enabling additional attributes; col. 18, lines 48 – 60 of Beauchamp].

**25. Claims 8 and 13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Beauchamp, Elder and Bayeh as applied to claim 3 above, and further in view of U.S. Patent NO. 5,911,776 to Guck.**

26. As to claim 8, Beauchamp as modified by Elder and Bayeh teaches the invention substantially as claimed. Beauchamp as modified does not teaches an interactive voice response (IVR) protocol.

However, Guck teaches server and client communication [col. 5, line 65 – col. 6, line 10] and an interactive voice response protocol [Interactive Voice Response; col. 5, line 65 – col. 6, line 10].

27. It would have been obvious to a person of ordinarily skilled in the art at the time of the invention to apply the teaching of an interactive voice response protocol as taught by Guck to the invention of Beauchamp as modified by Elder and Bayeh because this provides interactive manipulation of a database by allowing users to enter and retrieve information over the telephone [col. 3, lines 37 – 42 of Guck].

28. As to claim 13, Beauchamp as modified teaches the step (c)(i) is performed by a utility object [rules engine of the process server evaluates the process metadata against the step data returned from the universal client to determine the next step of the process; col. 24, lines 37 – 56 of Beauchamp].

### ***Response to Arguments***

29. Applicant's arguments filed April 15, 2004 have been fully considered but they are not persuasive.

30. Applicant argues, "Applicants do not use a universal client architecture as disclosed by Beauchamp. In contrast, Applicants disclose a middleware architecture" [p. 7, lines 12 – 13]. Examiner respectfully disagrees because a middleware architecture is not brought out in the claims and the claimed limitations do not preclude mapping a universal client architecture on the claims.

31. In response to applicant's argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which applicant relies (i.e., see p. 7, lines 13 – 23 of response) are not recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims.

32. Applicant appears to argue that a task object modeling the task suggests (1) a middleware framework and (2) the combination of Beauchamp and Elder would attempt to combine the universal client architecture of Beauchamp with the middleware framework of Elder [p. 9, lines 3 – 21]. As to (1), examiner respectfully disagrees because the limitation “a task object modeling the task” does not require a middleware framework. The examiner interpreted the limitation as using an object-oriented object to represent a task. As to (2), examiner respectfully notes that the Elder was relied upon to provide the teaching of a task object. Examiner did not suggest combining a universal client architecture with a middleware framework. Therefore, the combination of Beauchamp and Elder is deemed proper and teaches all the claimed limitations.

### ***Conclusion***

33. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
